

1 **ABSTRACT**

2 A method of verifying and managing multiple systems in a wireless
3 communications device and the apparatus thereof is disclosed, through which an
4 appropriate wireless communications system can be automatically selected from
5 several other alternative systems to log in a target network system. Also, the
6 selection process of wireless communications system can be carried out
7 according to a user-defined priority basing on a set of external conditions that is
8 related to the network operation costs, so that the network user can attain high
9 efficiency of network usage using the above apparatus.
